# Locking Failures Have Deadly Implications!

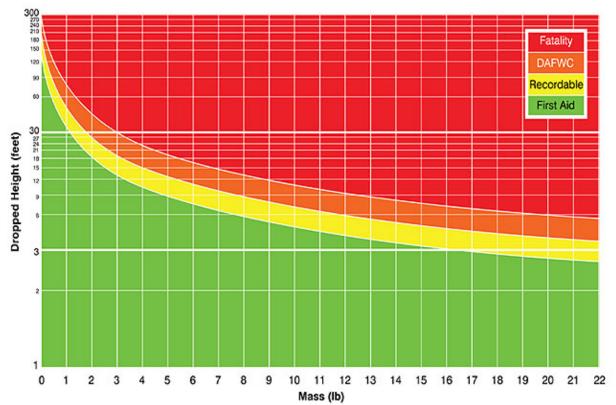

Shell found that 50% of incidents in wells were related to dropped objects (Drillingcontractor.org, 2010)

## **Reasons Threads Loosen with a Standard Thread**

Mismatched flank angles prevent proper flank contact

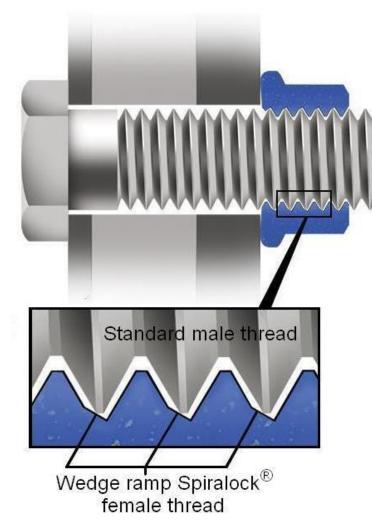

- 1. Relaxation of dispersions will cause loosening
- 2. Friction buildup lowers tension component
- Lead error prevents threads from seating properly and may cause interferences

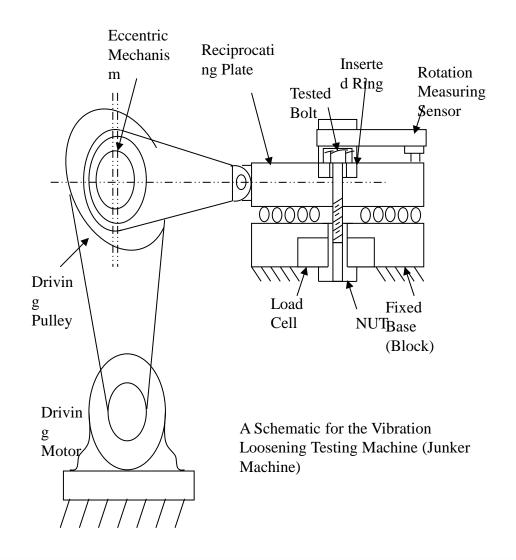

# SPL Wedge Ramp Technology

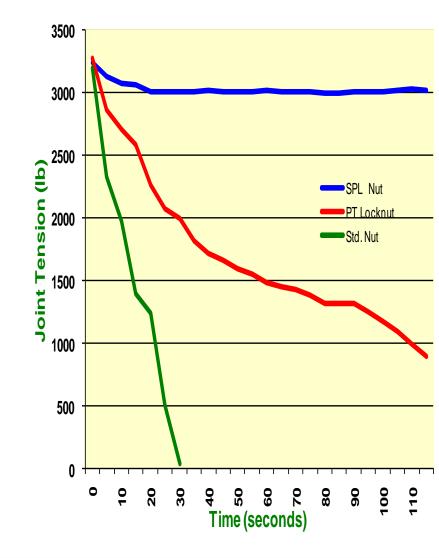

- Modified female thread form with a 30° wedge ramp at the thread root
- An evolutionary change in standard threads
- Compatible with standard fasteners
- Free-spinning until joint is snug
- •95% reduction in galling or corrosion
- Continuous spiral line of contact along entire length of thread engagement
- Wedge ramp generates radial load, prevents vibration loosening
- •100% Reusable for quick repairs turnarounds!
